Introduction

The users of Taxon will be extremely grateful to Dr Ernest Rouleau, of Montreal and to Dr Richard M. Lowden, of Santiago de los Caballeros, for having compiled an index to the first twenty volumes of this journal. The index will be published in two parts: I, *The scientific names*, by Ernest Rouleau and II, *Subject index*, by Richard M. Lowden. The second part will be accompanied by a bibliographic review of the twenty volumes with a list of the dates of publication of the separate numbers.

The index to *scientific names* contains over 75.000 references, all of which have been checked personally by the compiler. Names which are provided with a wavy underlining were first validly published in Taxon at the place stated, whether as names for new taxa, as nomina nova or simply as validations of previously non-validly published names.

An asterisk * indicates that the name is 'inclusive', in other words, the entry includes also references to obvious synonyms, e.g. under *Ranunculaceae will also be included Renoncules, Ranunculacées, etc.

All specific epithets have been spelled with a small initial letter, whether they were capitalized in the original text or not.

Evident typographic errors have been corrected, and care has been taken to provide the correct grammatical gender in all cases.

I am certain that many dedicated users of Taxon and all members of IAPT will join me in thanking Ernest Rouleau for his almost baffling "travail de Bénédictin." The information contained in these twenty volumes of Taxon has now become much more easily accessible thanks to the great care with which they have been scanned for names of taxa by someone fully acquainted with the subject matter.
